

FOR IMMEDIATE RELEASE

Touché Technologies Releases OptiBurst™ 2.0

Touché Tech's 3-D input system is now half the size, twice the power & a fraction of the cost.

ORLANDO, FL December 1, 2008 – Touché Technologies, LLC, parent company of www.Motion4U.org, proudly announces the release of its new OptiBurst™ 2.0 which is a 3-D input system designed for animation and special effects development in film, video games and broadcast. Version 2.0 has emerged as the product of a three-month, complete overhaul from its predecessor. In contrast to the previous model that had three cameras mounted on a six-foot bar, the new version has only two cameras on a three-foot bar. Unlike its predecessor, the new version is complete with all proprietary software, saving the consumer the additional cost of enabling software from another provider. Instead of having only one model, Touché Tech now touts two models of its new version priced at \$1995 for the Standard version and \$3995 for the Pro model.

According to Lou Magill, President of Touché Tech, “The OptiBurst™ 2.0 3-D input system is a major advancement over the current 2-D tools used in creating animation and special effects. The traditional methods of keyframing, path animation and procedural are highly labor intensive. Their results are not as convincing as they could be. OptiBurst™ 2.0 allows absolute and relative organic movement. It enables animators and effects artists to do more, do it better, do it significantly faster and with substantially less expense over what they are currently using. Now they have two models in attractive and highly portable packages that will mount on tripods, walls or ceilings at a cost of one-third to almost two-thirds less than the original version.”

In a dubious economic environment, entertainment production companies are seeking ways to increase their competitiveness. Now, more than ever in the entertainment industry, we are hearing demands for exceptional quality at the lowest cost possible. It has always been important; now it is critical. Touché Technologies seems to have an answer to those demands for content development in the entertainment industry, and possibly much more.

About Touché Technologies, LLC

Touché Technologies, LLC is a high-tech company which develops desk-top motion capture applications for various industries including film, video game and TV broadcast production. Its flagship program, the OptiBurst™ 3-D development interface, allows 3-D artists and animators to create and animate organically at the highest level with significantly less time and expense than is possible with conventional tools. OptiBurst™ currently works within “Maya” (by Autodesk), “After Effects in C4” (by Adobe) and the “Dna Ogre” render engine. In addition to the entertainment industry, OptiBurst™ is being used in the medical industry where it is currently advancing physical therapy models. OptiBurst™ is marketed by Motion4U, LLC, a subsidiary of Touché Technologies, LLC.
